

AutomationExercise.com - site review

Automation Exercise is a free, beginner-friendly platform for practicing web automation testing using Selenium, Cypress, Playwright, and other tools. It provides a live e-commerce demo site filled with elements that mimic real-world application behavior.

Positive:

The site covers a wide range of web testing scenarios - from login flows to product searches and cart operations - making it an excellent resource for learning and practicing end-to-end automation. It is stable, well-structured, and doesn't require user registration to get started.

Negative:

However, the design is slightly outdated, and some test flows (like account creation or payment) may behave inconsistently, which can confuse beginners who are troubleshooting test scripts.

Suggestion for improvement:

Improving the UI responsiveness and ensuring all flows work reliably under automation would increase its educational value. Adding test IDs or automation-friendly attributes to elements would also simplify selector handling for newcomers.

Conclusion:

Overall, Automation Exercise is a solid platform for testing practice and hands-on learning. With a few usability and stability improvements, it could become a go-to resource for QA engineers, students, and instructors alike.
